

# GoDaddy cPanel File Manager and FTP Clients

By Professor Floyd Jay Winters, 01/23/2019, revised 09/11/2022

[GoDaddy File Manager](#) | [Troubleshooting](#) | [FileZilla](#) | [VS Code](#) | [Notepad ++ FTP](#)

**Note1: When you work with GoDaddy, you will have two sets of usernames and passwords. One to log into GoDaddy. The second is needed to use an FTP client, such as FileZilla. If you use the GoDaddy File Manager, you will not need the second set of usernames and passwords.**

**Note2: The FTP or cPanel username is automatically assigned. It looks like: `lm5p8o1bzk2r`. You cannot change it. But you can change your FTP password in the cPanel Settings panel.**

## GoDaddy File Manager

The [www.godaddy.com](http://www.godaddy.com) File Manager is a temporary way to upload your files to your website. It is easy to understand and requires no setup once you set up your domain and hosting. But in the end, it is harder to use, because you must log in and enter your username and password, then navigate to Hosting, go to the cPanel, then go to your folder, and click on the Upload icon, then browse to your local folder... This process is time consuming.

Later you will want to use an FTP (File Transfer Protocol) client which is usually built into your editor. For instance, you can directly FTP from VS Code (if you set up a JSON file), FileZilla, Dreamweaver and Notepad++ and your editor will remember your password and folder paths.

Below are the pictorial directions for the GoDaddy File Manager:

- Log in to [www.GoDaddy.com](http://www.GoDaddy.com)  
Enter your **cPanel Username**; it will look something like: io58wikzfxyr  
Enter the **cPanel Password**.  
If you have not already written these down, go to Hosting in GoDaddy to locate your Username. You can also set or change your password there. Note the GoDaddy Username may be JaneDoe, but the cPanel Username is an automatically generated 12-character code for security reasons.
- **Navigate to Hosting and/or the cPanel – your screen may vary.**

Click the square, 9-dot Links button, and then click **Hosting**. (Your screen may vary)

My Pro

Logi

- Manage My Products
- Shop GoDaddy.com

---

QUICK LINKS

- Domains
- Websites
- Hosting & WordPress
- Email & Office
- SSL Certificates

Navigate to the **cPanel** (Your screen may vary)  
(Note also use cPanel Settings to change your password.)

## Hosting

DOMAIN/SERVER NAME	PRODUCT	PLAN/IMAGE NAME
<b>biminibaysailing.com</b> Active	<u>cPanel</u>	Economy Web Hosting with cPanel
<b>bradentonwebsitedesign.com</b> Active	cPanel	Economy Web Hosting with cPanel

Or you may see the following. You can click on the **File Manager** link, which may be easier than the FTP Manager link. But I usually just go straight to the **[cPanel Admin]** link and then choose the File Manager. Notice how you can view your FTP or cPanel credentials on this screen.

# biminibaysailing.com

**cPanel Admin** Account Actions

### Settings

Account Server

Primary domain  
biminibaysailing.com Change

---

cPanel login  
Abcd99# Copy

---

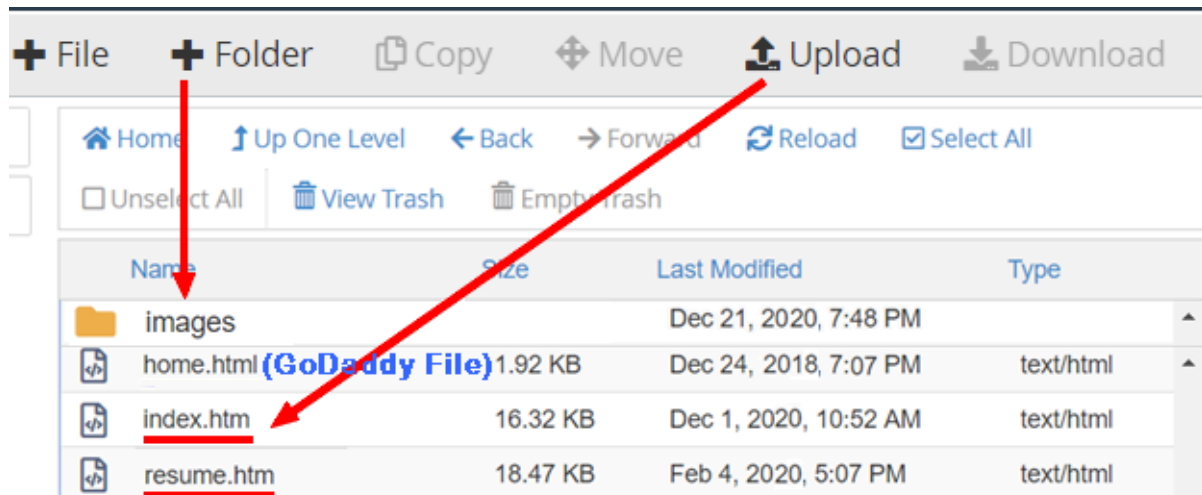

Password  
\*\*\*\*\* Change

**Note:**

Click on the **Blue Globe** to expand **public\_html**. That is where your site files are stored.

Name	Size	Last Modified	Type
application_backups	4 KB	Dec 29, 2020, 8:16 AM	httpd/unix-directc
logs	4 KB	Jan 15, 2020, 7:20 AM	httpd/unix-directc
mail	4 KB	Today, 3:51 PM	mail
public_ftp	4 KB	Feb 4, 2020, 4:51 PM	publicftp
<u>public_html</u>	4 KB	Sep 6, 2020, 7:26 PM	publichtml
ssl	4 KB	Jul 20, 2020, 11:53 PM	httpd/unix-directc

Click the **Upload** icon to Browse to your newly created index.htm file (on your **local drive**) and upload it to replace the GoDaddy **home.htm** placeholder file. Your new **index.htm** file has a higher priority than home.htm, so it will open by default. Below is what you will see after you upload your index.htm and resume.htm. Click **+ Folder** icon to create your images folder.

After unloading your files, type **your** domain address in the browser URL address bar and your new index.htm file should open.

On the top Nav bar are additional options for to **Rename**, **View**, and go **Up One Level** (to go from your images folder to your main folder) ... *Do not use Edit or HTML Editor*. Edit on your local computer. That way, you can test before going live and you always have a local backup. In the end, your **public\_html** folder will have these files in it:

images (folder)  
index.htm  
contact.htm  
contactsent.htm  
newsletter.htm  
portfolio.htm  
resume.htm  
yoursitename.css

## Troubleshooting files that do not display, using GoDaddy File Manager

### A. Home page does not come up

- 1 Is your home page file named: **index.htm** or **index.html**? (only use one of those two names) index.htm must be spelled correctly and in all **lower case**.
- 2 Can you see your uploaded **index.htm** when you browse to the **public\_html** folder?

### B. Images do not display

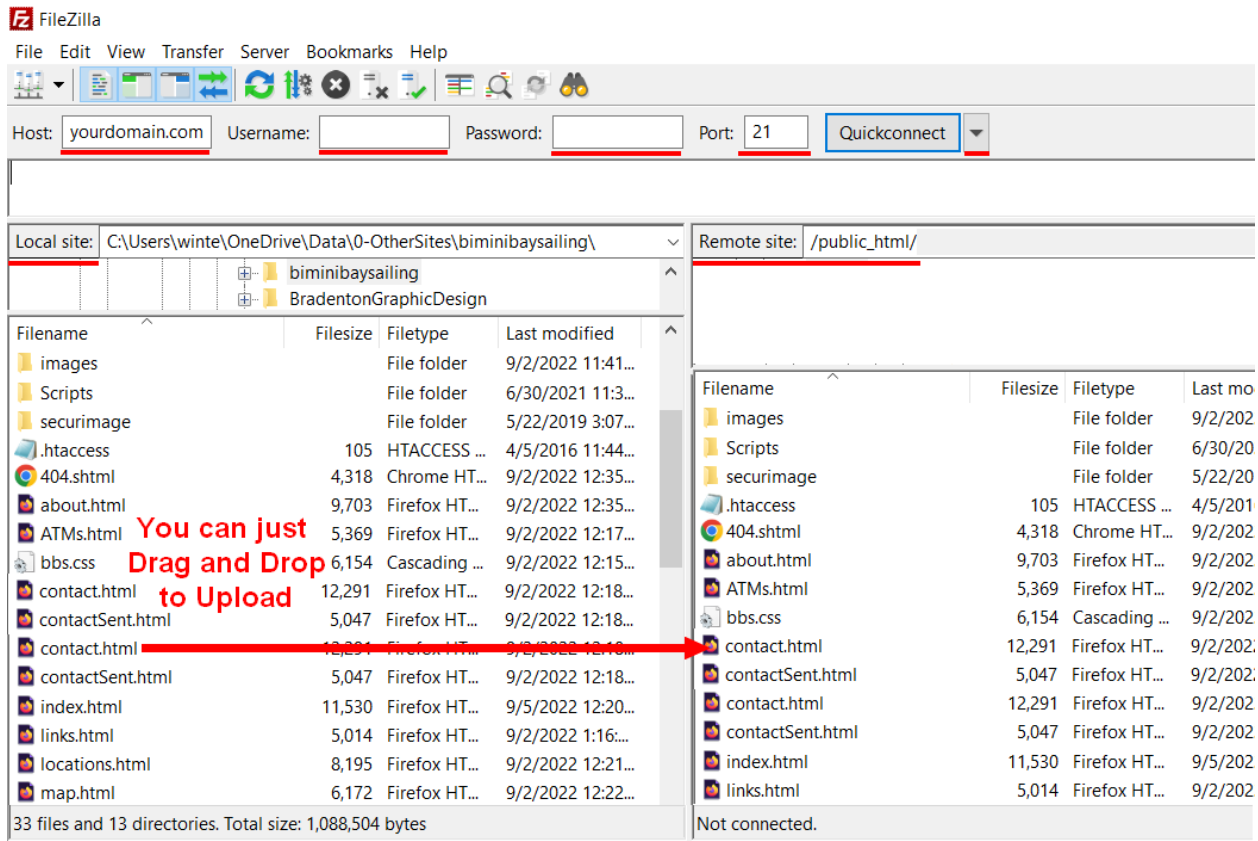

- 1 Did you click the **+ Folder** option to create an **images** folder inside the **public\_html** folder?
- 2 Can you see your uploaded *picture.jpg* when you browse to the online **images** folder?
- 3 Is your uploaded *picture.jpg* spelled exactly the same way in your html file as it is online? (The spelling is case sensitive!) ``

# FileZilla

V 2022/09/07, by Professor Floyd Jay Winters

FileZilla is a free download for FTP. See <https://filezilla-project.org/>

Once you enter your Domain Name, Username, Password, and Port (usually 21) FileZilla will remember your credentials. Browse to your local folder, then once connected, browse to your Remote folder (often **public\_html**). Just drag from the Local folder to the Remote folder to upload your file(s). And all you have to do is click the **Quickconnect** dropdown the next time you use FileZilla.

## VS CODE

Unfortunately, an FTP client is not built into VS Code. But you can add an FTP Extension. See below:  
It is a bit more difficult to set up FTP with VS Code. And there are two other drawbacks. Passwords tend to be visible when you view the config file. Also, files tend to be automatically uploaded on save. I prefer to only upload when I have the bugs worked out. But fortunately, there is an "**autosave**": false setting.

FTP (uploading your files to your web server) See [FTP Config file](#) below

<https://www.youtube.com/watch?v=3jB2vdZb-s> (2:38) FTP Simple Nice and short

[https://www.youtube.com/watch?v=Kgi5CLN\\_OF0](https://www.youtube.com/watch?v=Kgi5CLN_OF0) (6:27) cPanel settings, but use path **/public\_htm**

<https://www.youtube.com/watch?v=G1R5H6pnOyc> (9:21) FTP Simple

<https://www.youtube.com/watch?v=9L1ciOkHSAQ&t=1540s> (38:03) FTP Simple **Upgraded**

**NOTE:** After installing FTP-Simple, **Extensions** icon (4 squares) on the left **Activity Bar**, click FTP-Simple again and look at the FTP-Simple options.

<https://www.youtube.com/watch?v=RPBT01tg0DY&t=184s> (5:32) FTP Sync shown with cPanel

Uploads are set to automatic on save, but can be done manually:

Right-click on filename tab at top of window > Choose **ftp-simple: Save – Upload to FTP Server**  
**Follow the prompts at the top of the screen.**

VS Code extensions use a JSON file.

### JSON files

A **.json file** is a Javascript config file (JavaScript Object Notation)

Ex: **settings.json** for storing desired font-size and color theme, emmet settings...

Set through File > Preferences. View:

tap [F1] > Type **Preferences: Open Settings (JSON)**

Ex: **launch.json** tells vs code what browser to open for page preview

To see launch.json: View > Command Palette or tap [F1] > Type **launch**

Ex: **ftp-simple-temp.json** stores ftp domain name, username and password...

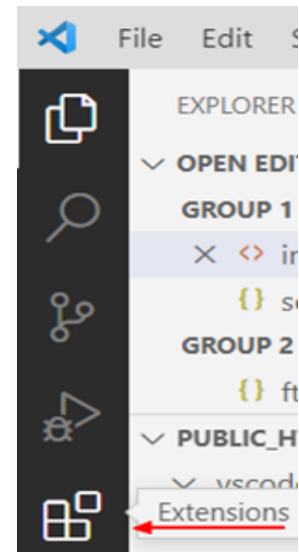

### FTP Config file

Click **Extensions** icon (4 squares) on the left **Activity Bar**.

Search for **FTP-Simple** and click [Install]

Then tap [F1] > Type FTP-Simple and choose Config - FTP connection setting to open the **ftp-simple-temp.json** template

```
1 [  
2 {  
3   "name": "Sample-Name of local host or web server",  
4   "host": "ftp.URLDomainName.com", or "host": "IP address", (Get IP address from cPanel)  
5   "port": 21, or "port": 22, (FTP is port 21. SFTP is 22).  
6   "type": "ftp", or "type": "sftp",  
7   "username": "Your FTP USERNAME", (It may be assigned in cPanel)  
8   "password": "Your FTP PASSWORD",  
9   "path": "/", or "path": "/public_html",
```

```

10  "autosave": true,                or "autosave": false,    (I prefer to save when ready)
11  "confirm": true                 or "confirm": false      (I do not mind confirming)
12  }
13 ]

```

Note: Quotes above are not curly quotes—~~These are curly quotes Do Not Use~~— "These are not curly quotes"

Note: Autosave will automatically upload to the server in the above configuration.

Note: To set up multiple sites: Copy lines 2 to 12. Add a , after line 12. Paste and modify copied code.

A. File > Preferences > Settings > Extensions > FTP-Simple > Remote Workspace: C:\websites\foldername  
 (You may have to close and reopen VS Code for settings to take effect and download files or right-click Explorer: ftp-simple: Download in working directory from FTP server)

B. BETTER to set up local directory: <https://www.youtube.com/watch?v=9L1ciOkHSAQ&t=1468s>  
 (@24:28)

As per above video, add the following to set a local path (after adding a comma at the end of line 11)"

```
12  "project": "c:/websites/Website1/"
```

Make local file code changes, then [Ctrl] [Shift] **S** – to start **S**ave to **S**erver

or right-click the file in the Explorer > choose ftp-simple: Save upload to FTP server

To **Upload**: (After creating the **Config file**, see above)

View > Command Palette or tap [F1] > Type FTP-Simple and choose Save: Upload to Server

After setup, it should upload automatically on Save.

When done uploading, click **Output** (on bottom) and select **FTP Simple** from dropdown to confirm

Tap [F1] > Type **FTP-Simple remote** and choose **Remote directory open to workspace**

(you can use this to open one of multiple domains that you may have configured)

and choose your domain name and then click to choose your current directory

OR Choose Terminal from top menu > New Terminal > choose FTP-simple under Output/Tasks on bottom

All your files will appear on the left side if you click the **Explorer** icon (upper right corner of Activity Bar).

To **Open**: You can now click a file on the left to open and edit. Or click File > Open Or click Go > Go to File  
 VS Code blocks saving a file to prevent overwriting changes that have been made **outside of the editor**.

When Done: View > Command Palette or tap [F1] > Type FTP-Simple > choose **Close** all FTP connections

# Downloading the Notepad ++ Plugin Manager and NppFTP

V 2018/10/03, by Professor Floyd Jay Winters

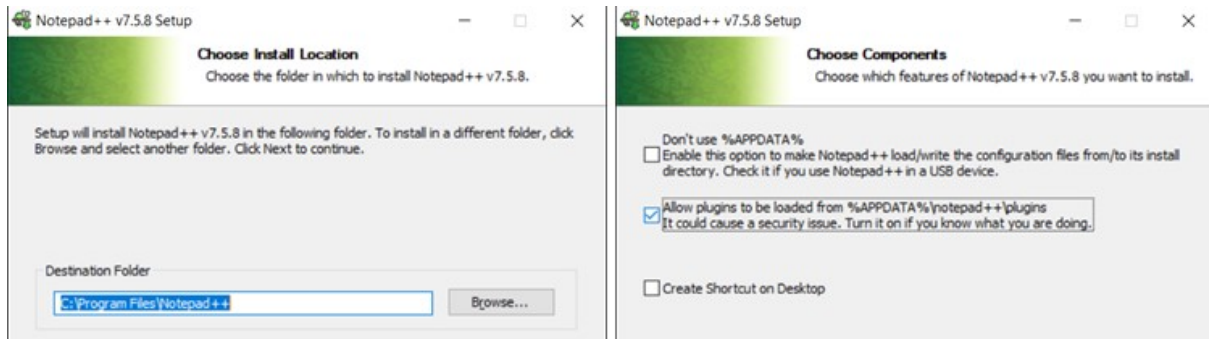

**YOUR SCREEN MAY VARY**

## 1. Download Notepad ++

See: <https://notepad-plus-plus.org/> and click on [**Download**] link

BUT if you have a 64bit system (Click Windows > System Information)

choose the easier **Notepad++ Installer 64-bit x64** and click **Run** when prompted

## 2. Download and install the Plugin Manager

The link we used to download the Plugin Manager was:

<https://github.com/bruderstein/nppPluginManager/releases>

We used: **PluginManager\_v1.4.12\_x64.zip** and saved it to the Downloads folder.

## 3. Right click to **Extract** the zip file from Download folder.

## 4. Open the new PluginManager Folder, then open the **plugin** subfolder, and copy **PluginManager.dll**

Paste it in **C:\Program Files\Notepad++\plugins**

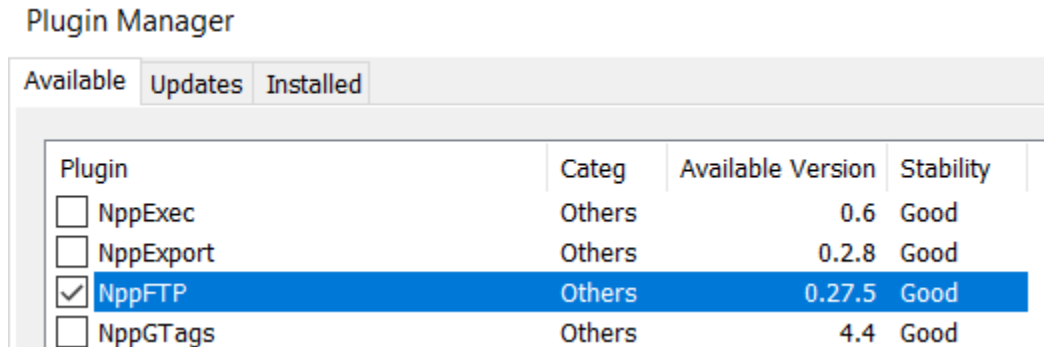

## 5. Open the **updater** folder and copy **gpup.exe**

Paste it in **C:\Program Files\Notepad++\updater**

6. Restart Notepad++ and choose Plugin Manager > **Show Plugin Manager**

7. Select NppFTP and click [**Install**]

8. Restart Notepad++ and choose NppFTP > **Show NppFTP Window**.

A NppFTP window will appear on the right side of the screen.

9. Click on the Settings icon (the gear, the last icon).  
Chose Profile Settings

10. Enter your **cPanel Username**; it will look something like: io58wikzfxyr

Enter the **cPanel Password**.

If you have not already written these down, go to Hosting in GoDaddy to locate your Username. You can also set or change your password there. Note the GoDaddy Username may be JaneDoe, but the cPanel Username is an automatically generated 12-character code for security reasons.

11. Click the **blue connect icon** in the upper left-hand corner of the NppFTP window (first icon).
12. Choose your website from the connect icon dropdown.
13. Open the file you want to upload.
14. Click the **green arrow upload icon** in the NppFTP window in the upper right-hand corner to upload the selected file to your online host.
